Secreted protein; human; cell proliferation; cytokine activity; tissue growth; cellular differentiation; regeneration; activin; inhibin; chemotactic; haemostatic; thrombolytic; tumour inhibition; anti-inflammatory activity; biomarker; ss. This DNA encodes a human secreted protein. The specification provides secreted protein sequences (AAM63681 to AAW63699) encoded by the nucleic acid sequences shown in AAV43601 to AAV43619. The invention provides a Secreted human polypeptides - having cytokine, cell proliferation differentiation, activin or inhibin, tumour inhibition or anti-inflammatory activities. method of identifying a secreted polypeptide which is modified by rough microsomes. The secreted proteins can be used in assays to determine biological activities, such as cytokine, cell proliferation, or cellular differentiation activities, tissue growth or regeneration, activin or chambian activity, chemotactic or chemokinetic activity, haemostatic or thrombolytic activity, receptor/ligand activity, tumour inhibition, or anti-inflammatory activity. The proteins can also be used as biomarkers, to identify tissues or cell types which expression. They can be used in protein interaction assays, to identify ligands or binding proteins. Or disease-specific alteration in protein expression. They can be used in protein interaction assays, to identify ligands or binding proteins. Compounds which affect the biological activities of the secreted proteins or their ability to interact with specific ligands can be identified or their ability to the protein can also be used to design diagnostic tests and therapeutic compositions for diseases which may be associated with altered expression of these proteins. Fusion proteins can be used to used to target other protein domains to cellular membrane or they can be secreted extracellularly. 888888888888888888888888

WPI; 2001-103149/11. P-PSDB; AAB20113. New PRO polypeptides, nucleic acids and (ant)agonists, useful for diagnosing and treating immune-related disorders, such as multiple sclerosis, rheumatoid arthritis and diabetes.

Claim 21; Fig 11; 127pp; English.

The present sequence is that of cDNA clone DNA35880-1160 (ATCC 209379)
centoding novel human immunomodulator protein PR0256 (UM0223) (see
AMB20113). The clone was isolated from a human placenta cDNA library. The
predicted protein (58 ADa, p. 6.22) shows homology to human bikunin,
indicating protease inhibitor activity. The invention provides
completed protein (58 ADA) p. 6.22) shows homology to human bikunin,
indicating protease inhibitor activity. The invention provides
completed proteins (see AAB10050-6.) encoding movel human PR0 proteins (see
AAB20108-20) including PR0256. Claimed compositions comprising these
completed in a mammal of tissue of a mammal, stimulating or enhancing an immune response in a mammal or increasing the proliferation of rimmune response in a mammal or increasing the proliferation of rimmune response in a mammal or increasing the proliferation of rimmune response in a mammal or increasing the proliferation of rimmune response in a mammal in response to an antigen. Claimed compositions
comprising the PRO polypeptide or its antagonist have the opposite
comprising the PRO polypeptide or its antagonist have the opposite
comprising the proliferations antibody. The disorder is selected from
a T cell disorder, involves administering the PRO polypeptide, an agonist

The present invention relates to PRO256 or its agonist/antagonist may be used to treat a cardiovascular, endothelial, or angiogenic disorder in a mammal, especially a human with cardiac hypertrophy, trauma, a type of tumour or age-related macular degeneration. PRO256 may be administered tumour or age-related macular degeneration. PRO256 may be administered tumour or age-related macular degeneration. PRO256 may be administered concentrated agent, a growth inhibitory agent, or angiogenic agent, a chemotherapeutic agent, a growth inhibitory agent, or a cytotoxic agent. PRO256 may also be used to treat the disorders above, preferably through administration via ex vivo gene therapy. PRO256 or its agonist may be used to inhibit endothelial cell growth, angiogenesis or protease activity of a hepatocyte growth factor, whereas an antagonist of PRO256 may be used to stimulate endothelial cell growth, angiogenesis or protease activity of a hepatocyte growth factor is protease activity of a hepatocyte growth factor is thibition of the protease activity of a hepatocyte growth factor is contained and secret selected from peripheral vascular disease, hepatic or renal injury or a restinosis disorder. The present sequence is human contained to a rethinosis disorder. The present sequence is human contained to a rethinosis disorder. The present sequence is human contained to a rethinosis disorder. The present sequence is human contained to a restinosis disorder. The present sequence is human contained to a restinosis disorder. The present sequence is human contained to a restinosis disorder. The present sequence is human contained to a restinosis disorder inhibitor, RRO256 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1114

The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, Kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, gilal, astrooytal, hypothalandic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polymolecide sequences are also useful in gene therapy. ABK40254-ABK40288 encode for the human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           995 cccaccaaccacarcrecaacacrircerirarecacecrecrirecaaccaacaacaac 1054

                                                                                                                                                                                                                                                                                                                                                                             ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardicovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides thrombophlebitis, lymphangitis, tumour including use as hybridisation probes, and in chromosome and gene mapping, and such an including use as hybridisation probes, and in chromosome and gene mapping, and probes used in the

This invention relates to the cDNA and protein sequences of novel
secreted and transmembrane polypeptides FRO polypeptides. The invention
also comprises a method for producing the protein of the invention means and antibodies specific for the protein of the
invention. The antibody may be used for detecting the PRO proteins of the
invention and may be used for modify their activity. polynucionides may
be used as hybridisation probes for a cDNA library to isolate the full-
length PRO cDNA or to isolate other CDNAs, to construct hybridisation
probes for mapping the gene which encodes that PRO and for genetic
analysis of individuals with genetic disorders, in assays to identify
other proteins or molecules involved in binding reaction, to generate
transgenic animals or knock-out animals which in turn are useful in the
development and screening of therapeutically useful reagents, for
chromosome identification, and tissue typing. The PRO polypeptides are
checomose identification, and tissue typing. The PRO polypeptides are
clectrophoresis purposes. The sequences may also be used to detect
overexpression on PRO polypeptides in cancerous tumours and for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New PRO polypeptides and polynucleotides encoding the polypeptides, useful in gene therapy, chromosome identification, tissue typing, ogenetic analysis of individuals with genetic disorders.
                                                                                                                                                                                   PRO; secreted protein; transmembrane protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             , Goddard A,

```

```
The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarctions, thromopolhebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention

cc factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a marmal (e.g. adrenal, lung, colon, breast, prostate, rectal, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating cantisense RNA and pNA and in gene therapy. The polynucleotides may also attisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are used in the development and screening of therapeutically useful.

The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for inducing endothelial cell tube formation and for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. This sequence represents a human PRO polynucleotide of the invention. 888888888888888888888

The invention relates to an isolated secreted/transmembrane (PRO)

Co polypeptide, having at least 80% sequence identity to a sequence selected

from any one of the 57 amino acid sequences given in specification, or to
a sequence encoded by a nucleic acid molecule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
in specification, or a sequence having at least 80% identity to PRO
co sequence encoded by a mucleic acid molecule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
in specification, or a sequence having at least 80% identity to PRO
co with or without its associated signal peptide, an extracellular domain of PRO
co with or without its associated signal peptide. Also included are vectors,
transformed host cells, anit-PRO antibodes, the nucleic acids encoding
CC with or without its associated signal peptide. Also included are vectors,
transformed host cells, anit-PRO antibodes, the nucleic acids encoding
CC with or without its associated signal peptide. Also included are vectors,
CC RCO1075, PRO21207, PRO21313 or PRO3134 polypeptide in the above nuclectide
conditional proble derived from any one of the above nuclectide
conditional acides are useful for stimulating the proliferation of human nicrovascular endothelial cells. PRO polypeptides are useful for
colon, breast, prostate, rectal, widney and liver. PRO231, PRO313, PRO3160,
CC PRO3189, PRO4199, PRO6308, PRO6000, PRO10275, PRO21207, PRO2033 and
colon, breast, prostate, rectal, for inducing endothelial cells are useful for inducing genomic and New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO20080 PRO21383, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy. present sequence encodes a PRO protein. Claim 2; Fig 9; 308pp; English.

and PRO21383 polypeptides are useful for stimulating the proliferation of human microvascular endothelial cells. PRO6071, PRO4487 and PRO6006 pumpan microvascular endothelial cells. PRO POLIFeration of human microvascular endothelial cells. PRO POLIFeration of human microvascular endothelial cells. PRO PRO PROFECT of the presence of tumour in a mammal, including tumours of lung, colon, breast, prostate, rectal, kidney and liver. PRO231, PRO1560, PRO189, PRO6499, PRO6308, PRO6000, PRO1075, PRO21207, PRO231, PRO189, PRO4499, PRO6308, PRO6000, PRO1075, PRO21207, PRO231, PRO189, PRO6499, PRO6400, PRO10775, PRO21207, PRO231, PRO189, PRO6400, PRO10776, PRO189, PRO189, PRO6400, PRO10776, PRO189, PRO1899, PRO6400, PRO107676, PRO1899, PRO5093 and COMMAN of Commation. PRO or the antibody are useful for isolating genomic and cDNA collegonucleotide probes are useful for isolating genomic and cDNA and DNA, and and as antisense probes. PRO nucleic acid is useful as hybridisation probe, in chromosome and gene mapping, in the generation of an antisense RNA and DNA, and for the preparation PRO polypeptides. PRO and PRO nucleic acid are useful as therapeutic agents, e.g. vaccines. The present sequence encodes a PRO protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1114
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1234
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1054

The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 80% sequence identity to a sequence selected

from any one of the 57 amino acid sequences given in specification, or to
a sequence encoded by a nucleic acid molecule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
in specification, or a sequence having at least 80% identity to PRO
lacking its associated signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodies, the nucleic acids encoding
PRO, PRO fusion proteins, inducing pachhelial cell tube formation (by
administering PRO281, PRO180, PRO189, PRO4499, PRO6308, PRO6600,
PRO16275, PRO21207, PRO2033 or PRO34274 polypeptide or its agonist) and
an oligonucleotide probe derived from any one of the above nucleotide
sequences. PRO6018 polypeptide is useful for stimulating the
proliferation or differentiation of chondrocyte cells. PRO1313, PRO20080

```
The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the projection or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. lung, colon, breast, prostate, rectal, kidney and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybrid;sation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides, such as tumours, for stimulating and inhibiting proliferation of human accordant endothelial cells and for inducing endochelial cell tube for inducing endochelial cells at human PRO polynucleotide of the

The invention relates to an isolated secreted/transmembrane (PRO)

Comparing at least 80% sequence identity to a sequence selected from any one of the 57 amino acid sequences given in specification, or to a sequence encoded by a nucleic acid molecule selected from any one of the mucleic acid molecule selected from any one of the mucleic acid molecule selected from any one of the mucleic acids deposited under any of the ATCC accession numbers given in specification, or a sequence having at least 80% identity to PRO lacking its associated signal peptide. Also included are vectors, it and proper cells, anti-PRO antibodies, the nucleic acids encoding PRO, PRO fusion proteins, inducing endothelial cell tube formation (by administering PRO281, PRO1860, PRO189, PRO4499, PRO6308, PRO6000, and processes. PRO6018 polypeptide is useful for stimulating the sequences. PRO6018 polypeptide is useful for stimulating the proliferation of nucleotides can or differation of chondrocyte cells. PRO21383 polypeptides are useful for stimulating the proliferation of number microvascular endothelial cells. PRO6071, PRO6487 and PRO5006 and PRO21383 polypeptides are useful for stimulating the proliferation of chondrocyte cells. PRO18016 collon, breast, prostate, rectal, kidney and liver. PRO5281, PRO1860, PRO189474 polypeptides are useful for inhibiting the presence of tumour in a mammal, including tumours of lung, colon, breast, prostate, rectal, kidney and liver. PRO5281, PRO18050, PRO1807474 polypeptides are useful kidney and liver. PRO5281, PRO18050, PRO1807474 polypeptides are useful kidney and liver. PRO5281, PRO18050, PRO18075, PRO21874 polypeptides are useful for inducing endothelial cell tube formation. PRO or the antibody are useful in the preparation of a sequence.
                                                                                                                                                                                                                                                                                                  ss; gene; human; PRO; secreted protein; transmembrane protein; endothelial cell tube formation; chondrocyte cell differentiation; microvascular endothelial cell; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; kidney tumour; liver tumour; cytostatic; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated PRO polypeptides e.g. PRO281 and PRO1560, useful in preparation of a medicament for treating a condition responsive to polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Grimaldi JC;

medicament for treating a condition responsive to PRO polypeptide. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences, for measuring or detecting the expression of an associated gene, and as antisense probes. PRO nucleic acid is useful as a hibridisation probe, in chromosome and gene mapping, in the generation of antisense RNA and for the preparation PRO polypeptides. PRO and PRO nucleic acid are useful as therapeutic agents, e.g. vaccines. The present sequence encodes a PRO protein.
                                                                                                                                                                                                                                                                       ö

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO21383, useful in molecular biology, chromosome and genegenerating antisense RNA and DNA, and in gene therapy.

2; Fig 9; 352pp; English. Claim

The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 804 sequence identity to a sequence selected from any one of troa any one of the 57 amino acid sequences given in specification, or too a sequence encoded by a nucleic acid molecule selected from any one of troa any one of the nucleic acids deposited under any of the ATCC accession numbers given in specification, or a sequence having at least 80% identity to PRO lacking its associated signal peptide. Also included are vectors, than for without its associated signal peptide. Also included are vectors, transformed host cells, anti-PRO antibodies, the mucleic acids encoding administering PROSI, PROSISO, PROSISO, PROSIOS, P

Sequence 2482 BP; 523 A; 792 C; 709 G; 458 T; 0 U; 0 Other;

generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO Polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for inducing endothelial cells tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
```

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polyrucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte calls and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in

Novel secreted and transmembrane polypeptides, PRO polypeptides useful for stimulating proliferation or differentiation of chondrocyte cells inducing endothelial cell tube formation.

Homo sapiens

The invention describes an isolated PRO (secreted and transmembrane)

C polypeptide (I). PRO6018 polypeptide is useful for stimulating the

proliferation or differentiation of chondrocyte cells. PRO20080,

C PRO21333 polypeptide is useful for simulating the proliferation of

the man microrascular endothelial cells. PRO6071, PRO487, or PRO6006

polypeptide is useful for inhibiting the proliferation of human

microrascular endothelial cells. PRO polypeptides such as PRO240,

PRO599, PRO1002, PRO4116, etc., are useful for detecting the presence of

tumour in a mammal wich involves comparing the level of expression of

the above mentioned polypeptides in a test sample of cells taken from the

mammal, and a control sample of normal cells of the same cell type, where

the mammal, the tumour being adveral tumour, input tumour, colon tumour in

breast tumour, prostate tumour, rectal tumour, colon tumour in

the mammal, the tumour being adveral tumour, input tumour, colon tumour,

breast tumour, prostate tumour, rectal tumour, or revical tumour,

breast tumour, prostate tumour, rectal tumour, colon tumour,

c compared to the control sample is indicative of the presence of tumour

the mammal, the tumour being adveral tor treating sports-related joint

breast tumour, prostate tumour, rectal tumour, or law propertide of a useful for treating sports-related joint

c problems, articular cartiage defects, osteoarthritis, or neumour or laver

tumour. PRO6018 polypeptide are useful for screening compounds to

c atthritis. PRO polypeptide are useful for screening compounds to

c ffect of the PRO polypeptide (antagonists) or prevent the

effect of the PRO polypeptide (antagonists). The polymulceotide (II)

and in the generation of anti-ense RNA and DNA.

c ffect of the PRO polypeptide (antagonists) or construct of PRO6018 polypeptides

c floagent native sequence of PRO general publication probes for mapping the general enther transgenic on antivitor profiles in the development and screening of the mapping profiles are also be use Novel isolated PRO1313, PRO20080 or PRO21383 polypeptide useful for stimulating proliferation of human microvascular endothelial cells, and PRO6018 polypeptide useful for stimulating proliferation of chondrocyte Grimaldi JC; Wood WI, Zhang Goddard A, Watanabe CK, m. Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
